

# Parabolic problems with dynamic boundary conditions

Catherine Bandle

(Basel, Switzerland)

## **Abstract**

An existence theory for local solutions of a parabolic problem under a dynamical boundary condition  $\sigma u_t + u_n = 0$  is developed and a spectral representation formula is derived. It relies on the spectral theory of an associated elliptic problem with the eigenvalue parameter both in the equation and the boundary condition. The well-posedness of the parabolic problem holds in some natural space only if the number of negative eigenvalues is finite. This depends on the parameter  $\sigma$  in the boundary condition. If  $\sigma \geq 0$  the parabolic problem is always well-posed. For  $\sigma < 0$  it is well-posed only if the space dimension is 1 and ill-posed in space dimension  $\geq 2$ . By means of the theory of compact operators the spectrum is analyzed and some qualitative properties of the eigenfunctions are derived. An interesting phenomenon is the “parameter-resonance”, where for a specific parameter-value  $\sigma_0$  two eigenvalues of the elliptic problem cross. Depending on the time some qualitative properties will be discussed.
